

Day 06 – Production Docker

DevOps Revision Handbook

Objective

Learn production-ready Docker practices for creating secure, lightweight, reliable, and efficient container images.

Topics Covered

Development vs Production, Image Optimization, Multi-stage Builds, .dockerignore, Docker Layer Caching, Alpine Images, Health Checks, Restart Policies, Resource Limits, Production Best Practices.

Production Workflow

Dockerfile → Optimize Layers → Multi-stage Build → Lightweight Runtime Image → Docker Registry → Production Deployment.

Best Practices

Use multi-stage builds, use .dockerignore, prefer Alpine images, copy dependency files before source code, optimize layers, configure health checks, restart policies, and resource limits.

Useful Commands

docker images
docker history IMAGE
docker stats
docker logs CONTAINER
docker system df
docker system prune

Interview Revision

What is a Multi-stage Build? Why use .dockerignore? Why use Alpine images? What is Docker layer caching? What is HEALTHCHECK? Why restart policies? Why resource limits?

Summary

Production Docker focuses on building optimized, secure, and reliable images that deploy quickly, consume fewer resources, and follow industry best practices.
