

Docker Day 05 – Docker Compose

Production DevOps Handbook

Objective

Learn Docker Compose for building and managing multi-container applications with a single configuration file.

Topics

docker-compose.yml, services, build, image, ports, environment, volumes, networks, depends_on, compose lifecycle.

Workflow

Read docker-compose.yml → Build/Pull Images → Create Networks → Create Volumes → Start Services → Application Ready.

Commands

```
docker compose up
docker compose up -d
docker compose down
docker compose ps
docker compose logs
docker compose exec backend bash
docker compose restart
```

Key Points

Use **build:** for your own application, **image:** for existing images. Docker Compose automatically creates defined networks and volumes. Services communicate through Docker DNS. **depends_on** controls startup order.

Interview Revision

Docker Compose vs Dockerfile, build vs image, depends_on, docker compose up, automatic networks and volumes.
