

# Docker Day 04 – Docker Networking

## Production DevOps Handbook

### Objective

Understand Docker networking, Docker DNS, bridge/custom networks, multiple networks, and port mapping.

### Topics

Bridge • Host • None • Custom Bridge • Docker DNS • Container Communication • Network Isolation • Port Mapping

### Important Commands

```
docker network ls
docker network inspect bridge
docker network create my-network
docker network connect another-network nginx1
docker run --network my-network nginx
docker run -p 8080:80 nginx
docker exec -it ubuntu1 bash
ping nginx1
```

### Key Learnings

Use custom bridge networks, communicate using container names instead of IPs, containers on different networks are isolated, one container can belong to multiple networks, and remember HOST\_PORT : CONTAINER\_PORT.

### Interview Topics

Bridge vs Host, Docker DNS, network isolation, multiple networks, port mapping, docker network inspect.
