

Day 07 – Docker Registry

DevOps Revision Handbook

Objective

Understand Docker Registries, image tagging, versioning, pushing, pulling, and production deployment workflows.

Topics Covered

Docker Registry, Docker Hub, Public vs Private Registries, Image Tags, Versioning, Docker Login, Build, Tag, Push, Pull, AWS ECR overview, Registry Best Practices.

Production Workflow

Write Code → docker build → docker tag → docker login → docker push → Docker Registry → docker pull → docker run.

Essential Commands

docker login

docker logout

docker build -t backend:v1.0 .

docker tag backend:v1.0 username/backend:v1.0

docker push username/backend:v1.0

docker pull username/backend:v1.0

Key Learnings

- Docker Registry stores Docker images.
- Docker Hub is the default public registry.
- Tag images before pushing.
- Use version tags instead of **latest** in production.
- Private registries are commonly used in enterprise environments.

Interview Revision

What is a Docker Registry? Public vs Private Registry? Why tag images? Why avoid latest? Explain the image lifecycle from build to deployment.

Summary

Docker Registries provide centralized storage and distribution for container images, enabling reliable collaboration and production deployments through consistent image versioning.
